55 The compounds of formula I form salts which are also within the scope of this invention. Pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful, e.g., in isolating or purifying the compounds of this invention.

The compounds of formula I may form salts with alkali metals such as sodium, potassium and lithium, with alkaline earth metals such as calcium and magnesium, with organic bases such as dicyclohexylamine, benzathine, N-methyl-D-glucamid and hydrabamine, and with amino acids such as arginine, lysine and the like. Such salts may be obtained by reacting compound I with the desired ion in a medium in which the salt predi-

When the R¹ to R⁵ substituents comprise a basic moiety, such as amino or substituted amino, compound I may form salts with a variety of organic and inorganic acids. Such salts include those formed with hydrochloric acid, hydrogen bromide, methanesulfonic acid, sulfuric acid, acetic acid, maleic acid, benzenesulfonate, toluenesulfonate, and various other sulfonates, nitrates, phosphates, borates, acetates, tartrates, malates, citrates, succinates, benzoates, ascorbates, salicylates, and the like. Such salts may be formed by reacting compound I in an equivalent amount of the acid in a medium in which the salt precipitates or in an aqueous medium followed by lyophilization.

The compounds of this invention may also be used in conjunction with hemodialysis.

The compounds of the invention can be administered orally or parenterally to various mammalian species known to be subject to such maladies, e.g., humans, in an effective amount within the dosage range of about 0.1 to about 100 mg/kg, preferably about 0.2 to about 50 mg/kg and more preferably about 0.5 to about 25 mg/kg (or from about 1 to about 2500 mg, preferably from about 5 to about 2000 mg) in single or 2 to 4 divided daily doses.

The active substance can be utilized in a composition such as tablet, capsule, solution or suspension containing about 5 to about 500 mg per unit dosage of a compound or mixture of compounds of formula I or in topical form for wound healing (0.01 to 5% by weight compound of formula I, 1 to 5 treatments per day). They

may be compounded in a conventional manner with a physiologically acceptable vehicle or carrier, excipient, binder, preservative, stabilizer, flavor, etc., or with a topical carrier such as Plastibase (mineral oil gelled with polyethylene) as called for by accepted pharmaceutical practice.

5 The compounds of the invention may also be administered topically to treat peripheral vascular diseases and as such may be formulated as a cream or ointment.

The compounds of formula I can also be formulated in compositions such as sterile solutions or suspensions for parenteral administration. About 0.1 to 500 milligrams of a compound of formula I is compounded with a physiologically acceptable vehicle, carrier, excipient, binder, preservative, stabilizer, etc., in a unit dosage form as called for by accepted pharmaceutical practice. The amount of active substance in these compositions or preparations is such that a suitable dosage in the range indicated is obtained.

The compounds of the present invention may be prepared as follows.

An amine

II

is treated with an acid (e.g., hydrochloric acid) and sodium nitrite in a solvent (e.g., water, acetic acid) at about -20 to 0°C, followed by sulfur dioxide, and a copper (I) salt (e.g., copper (I) chloride) in a solvent (e.g., acetic acid) at about 5 to 30°C to form a sulfonyl halide

III

Sulfonyl halide III is coupled with an isoxazolamine

IV

in an anhydrous organic solvent (e.g., pyridine) to form compound I.

Compound I wherein R¹, R² or R³ is aryl may be prepared by metal (e.g., palladium (0)) catalyzed coupling of the associated halo compound I (wherein R¹, R² or R³ is halogen) with aryl metalloids (i.e., aryl derivatives of tin, silicon, boron, and the like, such as phenylboronic acid). See, for example, the procedures of Example 4. A phenylboronic acid may be prepared by treating an aryl halide with n-butyllithium or magnesium turnings in tetrahydrofuran, and adding trimethylborate and finally aqueous hydrochloric acid. Alternatively, a phenylboronic acid may be prepared by adding a phenyl magnesium bromide to a solution of trimethyl borate and quenching with aqueous hydrochloric acid. Depending on the desired result, certain phenylboronic acids may be prepared by mixing an aryl dihalide with palladium (0) and adding a grignard reagent to prepare a desired aryl halide before treating the aryl halide as described above.

Also depending on the desired result, certain phenylboronic acids may be prepared by ortho lithiation of a substituted benzene. Treatment of the substituted benzene with, for example, n-butyl lithium removes an or-

the proton. Subsequent treatment with $B(OCH_3)_3$ and HCl results in an ortho-substituted phenylboronic acid.

There are several other alternatives for preparing a compound of the formula I wherein specifically R_1 is aryl. For example, a compound of the formula I may be prepared by metal (e.g., palladium (0)) catalyzed coupling of a halobenzene sulfonamide with a phenylboronic acid. The resulting biphenyl sulfonamide is reacted with a haloisoxazole and a base (e.g., Cs_2CO_3).

Alternatively, a halobenzene sulfonyl chloride may be reacted with a pyrrole. The product is coupled, using a metal (e.g., palladium(0)) catalyst; with a substituted phenylboronic acid, treated with a base (e.g., NaOH) and then PCl_5 , and finally treated with an isoxazamine of the formula IV.

Compounds of the formula I may also be prepared by treating a halobenzene, substituted in the meta position, with $ClSO_3H$. The resulting substituted halobenzene sulfonyl chloride is then treated as described above.

For compounds wherein any of R^1 to R^5 comprise reactive functionalities, the reactants may be treated with protecting agents prior to coupling. The amine portion of the sulfonamide core may also need to be protected when different R^1 , R^2 and R^3 groups are added. Suitable protecting agents and procedures for use thereof are generally known in the art. Exemplary protecting groups are benzyl, halocarbobenzyloxy, tosyl and the like for hydroxyl; carbobenzyloxy, halocarbobenzyloxy, acetyl, benzoyl, methoxyethoxymethyl and the like for amino. The sulfonamide nitrogen may be protected with methoxyethoxymethyl, trimethylsilylethoxymethyl, t-butyl and the like. Protecting groups may be removed from the resulting protected analogues of compound I by treatment with one or more deprotecting agents. Suitable deprotecting agents and procedures for use thereof are generally known in the art.

To form compound I wherein one or more of R^1 to R^3 is $-NR^7R^8$ and R^7 and/or R^8 is $-C(O)R^6$, the associated nonacyl sulfonic acid

V

is treated with water and an alkali metal hydroxide (e.g., sodium hydroxide) to form a sulfonic acid salt

VI

wherein M^+ is a lithium, sodium or potassium ion. Salt VI is treated with an acylating agent (e.g., acetic anhydride) at about 90 to 110°C in either the acylating agent as solvent or in an anhydrous organic solvent (e.g., pyridine) to form the associated acylamine of formula VI, wherein one or more of R^1 , R^2 and R^3 is $-NR^7R^8$ and at least one of R^7 and R^8 is $-C(O)R^6$. Acylamine VI is then treated with a halosulfonic acid solution (e.g., chlorosulfonic acid) or with another halogenating agent (e.g., phosphorus pentachloride, thionyl chloride) at about 0°C to 80°C to form an acyl-sulfonic halide III, which is coupled with isoxazamine IV as described above to form compound I wherein at least one of R^1 , R^2 and R^3 is $-NR^7R^8$ and at least one of R^7 and R^8 is $-C(O)R^6$.

To form compound I wherein one or more of R^1 to R^3 is alkoxy, the associated sulfonic acid V wherein one or more of R^1 to R^3 is hydroxy may be treated with an alkylating agent (e.g., dimethylsulfate) and an alkali metal hydroxide (e.g., sodium hydroxide) in an aqueous/organic solvent mixture (e.g., water/ethanol). The resulting alkoxy sulfonic acid salt VI may be used as described above to form compound I.

Monoamines of formula I (for example having $-NR^7R^8$ wherein one of R^7 and R^8 is hydrogen) are prepared from the associated free amine (for example wherein R^7 and R^8 are both hydrogen). The free amine is treated with (1) an alkylating agent (e.g., acetone), (2) a reducing agent (e.g., sodium cyanoborohydride) or hydrogen gas (H_2) and a catalyst (e.g., palladium on carbon), and (3) an acid (e.g., acetic acid, hydrochloric acid) in an

organic solvent (e.g., methanol) to form the associated monoamine compound I. Diamines of formula I, of course, may be similarly prepared. Additionally, the monoamines may be acylated.

Monoamines of formula I (for example having $-NR^7R^8$ wherein one of R^7 and R^8 is hydrogen) may also be prepared from the associated acylamine by treatment with a reducing agent, for example, borane.

The invention will now be further described by the following working examples, which are preferred embodiments of the invention. These examples are meant to be illustrative rather than limiting.

Example 1

N-(3,4-Dimethyl-5-isoxazolyl)[1,1'-biphenyl]-2-sulfonamide

A. 2-Phenylbenzenesulfonyl chloride

2-Aminobiphenyl (5.08 g, 30 mmol) was added in one portion to a mixture of concentrated hydrochloric acid (10 mL) and glacial acetic acid (3 mL) in a beaker equipped with a mechanical stirrer. The thick pink hydrochloride salt was cooled in a dry ice-ethanol bath to -10°C . A solution of sodium nitrite (2.24 g, 32.5 mmol) in water (3.5 mL) was added dropwise at a rate such that the temperature did not exceed -5°C . This mixture was stirred for 45 min maintaining the temperature between -10°C and -5°C . In a separate beaker, sulfur dioxide gas was bubbled through 30 mL of glacial acetic acid under vigorous stirring for 20 minutes. Copper(I) chloride (0.75 g) was added to this solution and bubbling of sulfur dioxide gas was continued until the yellow-green suspension became blue-green and most of the solids dissolved (about 30 minutes). This mixture was cooled to 10°C in an ice bath with stirring and to it was added the diazotization mixture in portions over 30 minutes, after which period the ice-bath was removed and the mixture was allowed to warm to room temperature. The green mixture was stirred for an additional 30 minutes and poured into ice-water (100 mL, 1:1) and the precipitated gummy solid was extracted with ether (3 x 75 mL). The combined extracts were washed with saturated sodium bicarbonate solution until neutral and washed with water (2 x 50 mL), dried (magnesium sulfate) and concentrated under vacuum to yield 5.0 g (66%) of compound A as a light brown solid.
